# Heavy Charged Lepton Searches

## Charged Heavy Lepton MASS LIMITS

### Sequential Charged Heavy Lepton ($L^{\pm}$) MASS LIMITS

These experiments assumed that a fourth generation $L^{\pm}$ decayed to a fourth generation $\nu_L$ (or $L^0$) where $\nu_L$ was stable, or that $L^{\pm}$ decays to a light $\nu_\ell$ via mixing.

See the "Quark and Lepton Compositeness, Searches for" Listings for limits on radiatively decaying excited leptons, *i.e.* $\ell^* \to \ell\gamma$. See the "WIMPs and other Particle Searches" section for heavy charged particle search limits in which the charged particle could be a lepton.

[1] ACCIARRI 96G assumes LEP result that the associated neutral heavy lepton mass > 40 GeV.

[2] The AHMED 94 limits are from a search for neutral and charged sequential heavy leptons at HERA via the decay channels $L^- \to e\gamma$, $L^- \to \nu W^-$, $L^- \to eZ$; and $L^0 \to \nu\gamma$, $L^0 \to e^- W^+$, $L^- \to \nu Z$, where the $W$ decays to $\ell\nu_\ell$, or to jets, and $Z$ decays to $\ell^+\ell^-$ or jets.

[3] RILES 90 limits were the result of a special analysis of the data in the case where the mass difference $m_{L^-} - m_{L^0}$ was allowed to be quite small, where $L^0$ denotes the neutrino

into which the sequential charged lepton decays. With a slightly reduced $m_{L^\pm}$ range, the mass difference extends to about 4 GeV.

[4] STOKER 89 (Mark II at PEP) gives bounds on charged heavy lepton ($L^+$) mass for the generalized case in which the corresponding neutral heavy lepton ($L^0$) in the SU(2) doublet is not of negligible mass.

[5] ABE 88 search for $L^+$ and $L^- \rightarrow$ hadrons looking for acoplanar jets. The bound is valid for $m_\nu < 10$ GeV.

[6] ADACHI 88B search for hadronic decays giving acoplanar events with large missing energy. $E_{cm}{}^{ee} = 52$ GeV.

[7] Assumes associated neutrino is approximately massless.

[8] ADEVA 85 analyze one-isolated-muon data and sensitive to $\tau$ <10 nanosec. Assume B(lepton) = 0.30. $E_{cm} = 40$–47 GeV.

[9] BARTEL 83 limit is from PETRA $e^+e^-$ experiment with average $E_{cm} = 34.2$ GeV.

[10] BERGER 81B is DESY DORIS and PETRA experiment. Looking for $e^+e^- \rightarrow L^+L^-$.

[11] BRANDELIK 81 is DESY-PETRA experiment. Looking for $e^+e^- \rightarrow L^+L^-$.

[12] AZIMOV 80 estimated probabilities for $M + N$ type events in $e^+e^- \rightarrow L^+L^-$ deducing semi-hadronic decay multiplicities of $L$ from $e^+e^-$ annihilation data at $E_{cm} = (2/3)m_L$. Obtained above limit comparing these with $e^+e^-$ data (BRANDELIK 80).

[13] BARBER 80B looked for $e^+e^- \rightarrow L^+L^-$, $L \rightarrow \nu_L^+ X$ with MARK-J at DESY-PETRA.

[14] ROTHE 69 examines previous data on $\mu$ pair production and $\pi$ and $K$ decays.

## Stable Charged Heavy Lepton ($L^\pm$) MASS LIMITS

| *VALUE* (GeV) | *CL%* | *DOCUMENT ID* | | *TECN* |

[15] ADACHI 90C put lower limits on the mass of stable charged particles with electric charge $Q$ satisfying $2/3 < Q/e < 4/3$ and with spin 0 or 1/2. We list here the special case for a stable charged heavy lepton.

## Charged Long-Lived Heavy Lepton MASS LIMITS

| *VALUE* (GeV) | *CL%* | *DOCUMENT ID* | | *TECN* | *CHG* | *COMMENT* |
|---|---|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | | |
| >574 | 95 | CHATRCHYAN | 13AB | CMS | | Leptons singlet model |

| none 0.97–1.03 | | [18] BARNA | 68 | CNTR | – | Long-lived |

[16] ANSORGE 73B looks for electron pair production and electron-like Bremsstrahlung.

[17] BUSHNIN 73 is SERPUKHOV 70 GeV $p$ experiment. Masses assume mean life above $7 \times 10^{-10}$ and $3 \times 10^{-8}$ respectively. Calculated from cross section (see "Charged Quasi-Stable Lepton Production Differential Cross Section" below) and 30 GeV muon pair production data.

[18] BARNA 68 is SLAC photoproduction experiment.

## Doubly-Charged Heavy Lepton MASS LIMITS

| *VALUE* (GeV) | *CL%* | *DOCUMENT ID* | | *TECN* | *CHG* |
|---|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| none 1–9 GeV | 90 | [19] CLARK | 81 | SPEC | ++ |

[19] CLARK 81 is FNAL experiment with 209 GeV muons. Bounds apply to $\mu_P$ which couples with full weak strength to muon. See also section on "Doubly-Charged Lepton Production Cross Section."

## Doubly-Charged Lepton Production Cross Section ($\mu N$ Scattering)

| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $<6.\times10^{-38}$ | 0 | [20] CLARK | 81 | SPEC | ++ |

[20] CLARK 81 is FNAL experiment with 209 GeV muon. Looked for $\mu^+$ nucleon $\rightarrow \overline{\mu}^0_P$ X, $\overline{\mu}^0_P \rightarrow \mu^+\mu^-\overline{\nu}_\mu$ and $\mu^+ n \rightarrow \mu^{++}_P$ X, $\mu^{++}_P \rightarrow 2\mu^+\nu_\mu$. Above limits are for $\sigma\times$BR taken from their mass-dependence plot figure 2.
